

IKARUS
mobile.security
for MDM

Protection and security for corporate mobile devices

IKARUS mobile.security for MDM complements your server-side security measures and closes the gateways that open mobile devices with access to your company network. Amplify your mobile device management with professional virus and malware detection, web security with individual filter settings and real-time threat statistics.

Professional Android security app for your MDM

In order to use the tried-and-tested virus and malware protection of IKARUS mobile.security, the MDM administrator creates a configuration file that specifies the activated features, scan and update intervals, blacklists and whitelists of URLs and the threat statistics server. The file is also digitally signed.

As soon as the app is installed and configured by the MDM software, your devices will then be proactively protected in the background from infections that appear in apps, downloads and the Internet. The app also continues to function if the device temporarily loses its internet connection or is not connected to the MDM server.

For controlled implementation of your company policies, the app settings can only be configured centrally by the MDM administrator. They can be viewed using the terminal devices, but not edited. On the device itself, only (additional) scans and database updates can be started and infected files deleted. All user actions that are issued on app alerts are recorded in current statistics, along with any threats found. This allows you to transparently track potential threats and risks at all times.

Product highlights

Protection against viruses, SPAM and malware

- » On-demand and on-access virus scans
- » URL filter for Android and Chrome browsers

Configuration options

- » Update frequency and settings
- » Individual URL blacklists and whitelists
- » Temporary unblocking of infected files
